WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). All other cases are classified as "disease", bearing in mind that under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties.

Admissions rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant".

Unless otherwise specified, normal bed capacity in this report is defined in Par. 36b (1) and (2) of AR40-1080, 10 December 1943, and Par. 14 WD Circular 43, 1 February 1944. This includes the T/O capacity of non-fixed hospitals but excludes convalescent facilities. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 7 APRIL 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rate from disease decreased slightly, while the admission rate from injury increased with the result that there was relatively little change in the admission rate from all causes. Lower morbidity from colds, influenza, etc. was responsible for the decline in the admission rate from disease. For the week ending 7 April 1944 the admission rate from all causes was reported at 656 per year per thousand, and the admission rate from disease was reported at 586 per thousand both being about 30 percent below the corresponding rates for the week ending 9 April 1943.

The admission rate from injury for the week ending 7 April 1944 increased to 70 per thousand. Morbidity from injury has been on a relatively low level of about 65 to 70 per thousand since about the middle of January.

Respiratory Causes:

The admission rate from colds, influenza, etc. continued downward and for the week ending 7 April 1944 was reported at 173 per thousand or about 6 percent under the rate for the preceding week and nearly 45 percent lower than for the corresponding week of April 1943. It is noteworthy that morbidity from colds, influenza, etc. has since the latter part of January 1944 exhibited a downward trend almost parallel to that recorded in 1943, but with admission rates in 1944 being about 130 to 140 per thousand lower than in 1943.

The admission rate from all forms of pneumonia decreased to 13 per thousand or more than 40 percent under the rate for the corresponding week of 1943.

Common Communicable Diseases:

Lower admission rates were reported for all of the common communicable diseases except rheumatic fever, which showed only a slight increase. Morbidity from "new" venereal diseases (excluding EPTS cases) dropped to the lowest rate reported thus far in 1944. A sharp drop was recorded in the number of new cases of measles.

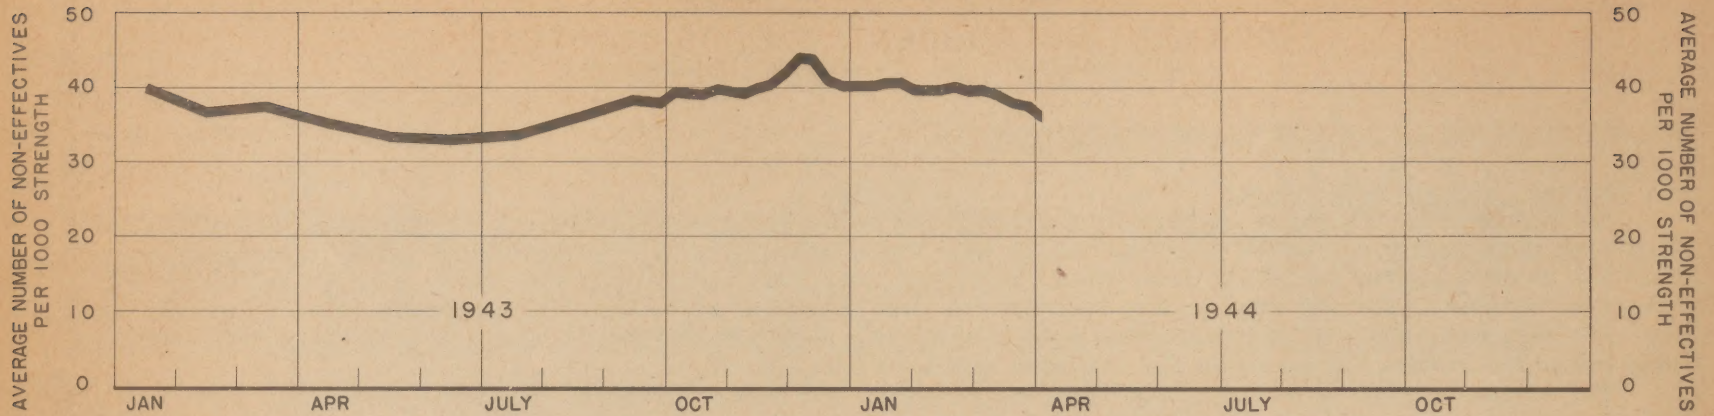

VARIATION IN MORBIDITY BY SERVICE COMMAND:

All Causes: Disease and Injury:

Slight increases in the admission rates from all causes and from disease were experienced in the Third, Seventh, and Eighth Service Commands and the Military District of Washington. Substantial declines in morbidity from all causes and from disease were reported by the First, Second, Fifth, and Sixth Service Commands. In the Sixth Service Command the lower admission rate from disease was entirely accounted for by lower morbidity from respiratory causes. Lower admission rates from respiratory causes were largely responsible for the decline in

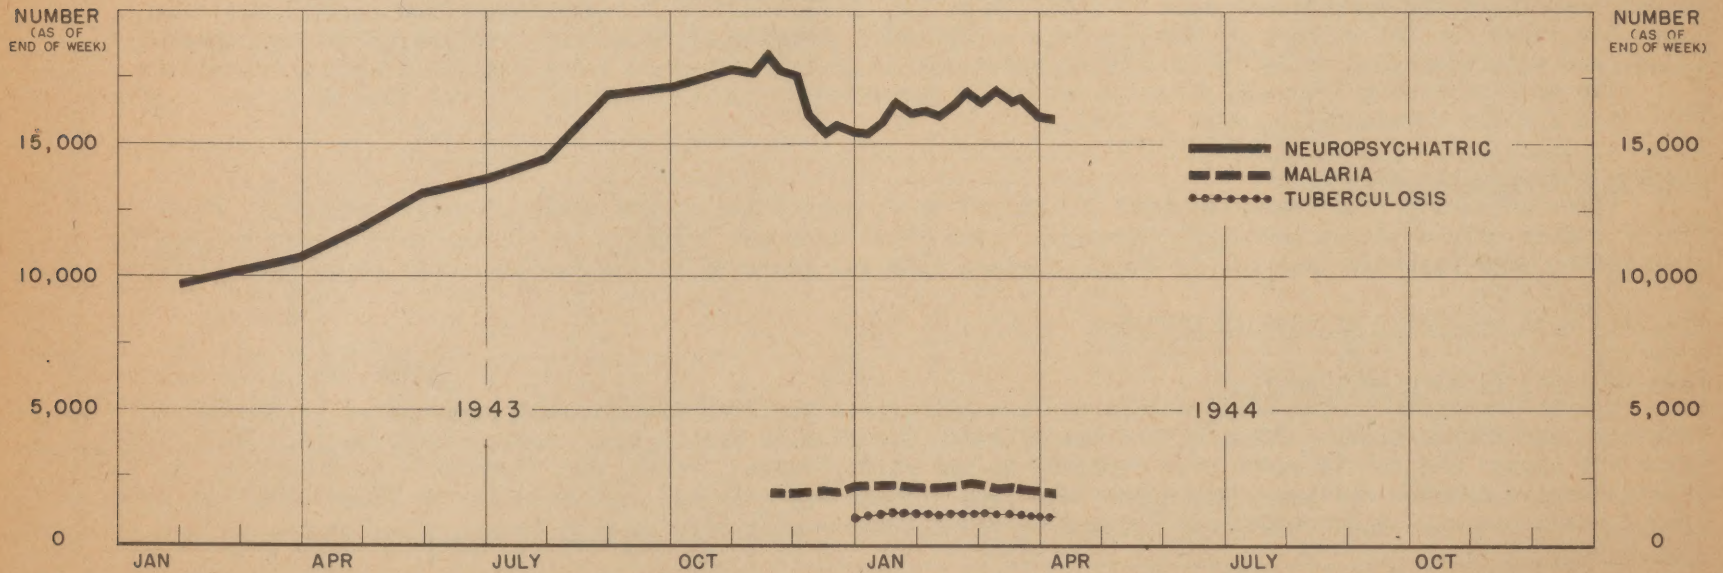

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 7 APRIL 1944

COMMENT ON CURRENT TRENDS (CONT'D)

morbidity in the First Service Command and partly so in the Fifth Service Command. The lower morbidity reported by the Second Service Command was apparently associated partly with a movement of troops into that Service Command and partly with a sizeable decrease in the number of venereal EPTS cases at Camp Upton.

The highest morbidity from all causes (809 per thousand) and from disease (744 per thousand) was registered in the Second and Seventh Service Commands which reported practically identical admission rates. The lowest morbidity from all causes (592 per thousand) was reported from the Fourth Service Command; however, the Eighth and First Service Commands registered almost equally low rates. The Eighth Service Command continued to experience the lowest morbidity from disease, with the Fourth Service Command reporting an admission rate only fractionally higher.

Respiratory Causes:

The Third, Fourth, and Eighth Service Commands and the Military District of Washington reported substantially the same morbidity from colds, influenza, etc. as in the previous week. All of the other service commands experienced markedly lower admission rates with the largest decreases being reported by the First, Sixth, and Seventh Service Commands. The Sixth Service Command nevertheless continued to show the highest admission rate from colds, influenza, etc. (287 per thousand), while the lowest admission rate (128 per thousand) was again reported by the Fourth Service Command. A very sharp decline in morbidity from pneumonia was reported from the Sixth Service Command. Only the Second Service Command reported higher morbidity from pneumonia as compared with the preceding week.

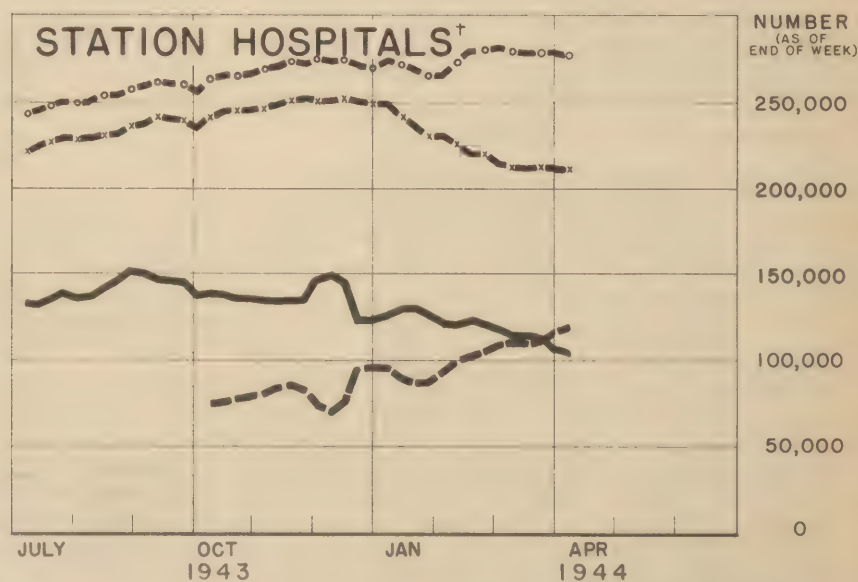

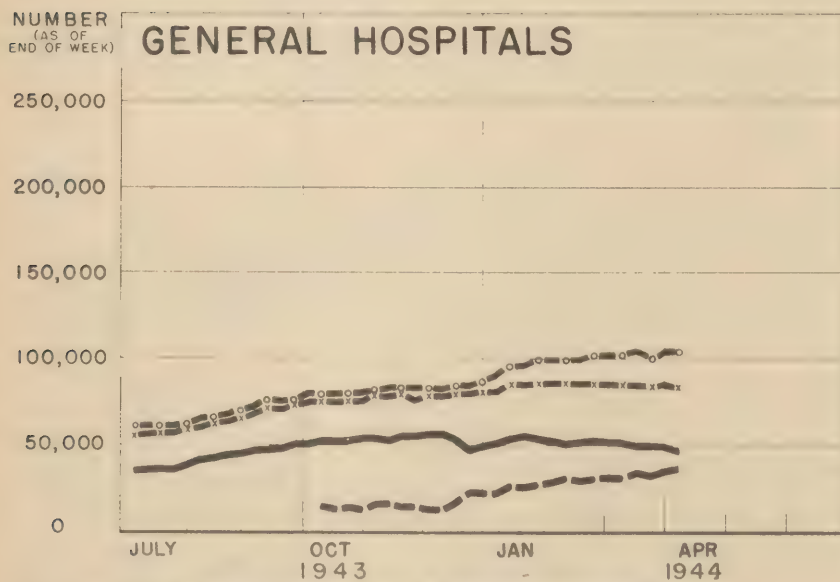

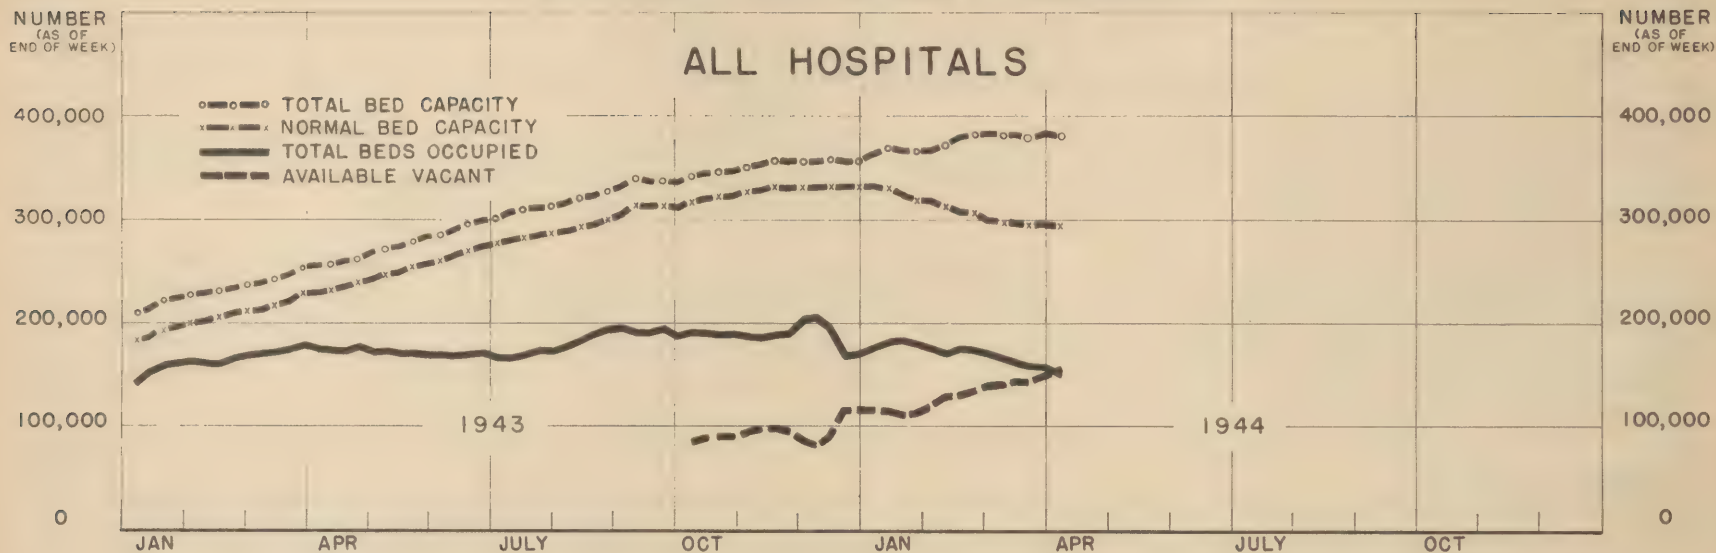

Common Communicable Diseases:

A very sharp drop in morbidity from "new" venereal disease (excluding EPTS cases) was reported for the Third Service Command. A marked increase in morbidity from such venereal disease was recorded in the First Service Command, while the Second Service Command and the Military District of Washington were the only other commands to report higher morbidity as compared with the preceding week. During the week ending 7 April 1944 the Second Service Command showed the highest morbidity from these causes (41 per thousand); it should be borne in mind that a large proportion of these venereal infections were among task force troops not under the direct jurisdiction of the Second Service Command.

The decrease in the number of new cases of measles was chiefly accounted for by the markedly lower number of cases being reported from the Fourth and Eighth Service Commands; there were some changes in the incidence of new cases of mumps, but the Fourth Service Command continued to account for over 30 percent of the total number of new cases. This Service Command also reported more than 40 percent of the total number of new cases of meningitis. The Seventh Service Command accounted for nearly 25 percent of the total number of new cases of scarlet fever and for over 30 percent of the new cases of rheumatic fever.

 †ALSO INCLUDES BEDS IN NON-FIXED HOSPITALS AT MANEUVER AREAS.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 7 APRIL 1944

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week decreased to about 35 per thousand strength.

Since the last week of January 1944 the number of neuropsychiatric cases remaining has fluctuated in the range from 16,000 to 17,000 and for the week ending 7 April 1944 was reported at 15,940. The number of malaria cases under treatment has declined in recent weeks from a high of 2,230 on 25 February to 1,835 on 7 April 1944; only 15 of the 1,835 malaria cases presumably were acquired in the United States. The number of tuberculosis cases remaining under treatment was reported at 1,068 as of 7 April 1944.

CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 7 April 1944 was reported at about 381,500 or the same as at the end of the previous week. The number of beds occupied decreased to 150,500 or 5,000 less than at the end of the preceding week, while the number of "available vacant" beds increased to almost 155,000. Total beds occupied represented 39 percent of total bed capacity. There were 2 stations with bed capacity of about 2,200 having no "available vacant" beds; no General Hospitals were included among them.

The number of normal beds decreased by about 2,000 and as of 7 April 1944 was reported at about 294,500 or 77 percent of the total bed capacity. Included in the normal bed capacity on 7 April 1944 were 10,080 T/O hospital beds and tentage, mostly in maneuver areas, while the total bed capacity included 10,690 such beds.

The total bed capacity of General Hospitals, which has shown a steady increase in recent months, was reported at about 104,000 as of 7 April 1944. On the same date about 47,000 of these beds (or 45 percent) were occupied. The "available vacant" beds at General Hospitals numbered 36,000 as of 7 April 1944. Normal beds at General Hospitals have been maintained at a level of about 85,000 since the beginning of the year.

The total bed capacity of Station Hospitals (including the relatively small number of beds in maneuver areas mentioned above) has remained practically level since the beginning of the year at about 275,000 beds, while the normal beds in these hospitals declined sharply from 250,000 as of 7 January 1944 to 211,000 as of 7 April 1944. Total beds occupied as of 7 April 1944 numbered 104,000 or about 37 percent of the corresponding total bed capacity. Station Hospitals had 119,000 "available vacant" beds as of 7 April 1944, the highest number yet reported.

As of 7 April 1944 the bed capacity of convalescent facilities in General Hospitals numbered 9,706 beds of which 4,000 beds, or 41 percent, were occupied.

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 31 MARCH 1944

PRISONERS OF WAR

During the five week period ending 31 March 1944, morbidity from all causes among prisoners of war was at the relatively low level of about 500 admissions per year per thousand strength or about 70 percent of that for U.S. troops in the Continental United States during the same period. Morbidity from all diseases combined during March was slightly less than 425 per thousand strength, while the admission rate for injury was about 80 per thousand. The March admission rates from all causes and from all diseases combined among prisoners of war were only about 2 percent higher than those recorded in February. The March admission rate for injury remained on substantially the same level as during the previous two months and was about 25 percent higher than the corresponding rate for U.S. troops in this country.

The disease admission rate among German prisoners was about 15 percent higher than among Italian prisoners, while morbidity from injuries for Germans was about $2\frac{1}{2}$ times as high as for Italians, who continued to experience very low morbidity from this cause (about 35 per thousand). The relatively small strength of the Japanese prisoners of war makes significant comparisons based on a single month's data impossible. However, for the first three months of 1944, morbidity from all causes among the Japanese was about 450 per thousand or 15 percent lower than for other prisoners of war.

Morbidity from colds, influenza etc. among prisoners of war decreased for the third successive month to the very low figure of 77 per thousand for March, as contrasted with rates of 93 and 182 per

thousand for February and January respectively. The March rate compares most favorably with the lowest seasonal rates experienced by U.S. troops during the summer months and is far below the present experience of our troops in this country (about 225 per thousand). Morbidity from colds, influenza etc. was appreciably higher for Italians than for Germans, the admission rates being 118 and 61 per thousand respectively. Morbidity from all forms of pneumonia was likewise at the very low level of about 3 per year per thousand strength or only about 20 percent of the corresponding rate for U.S. troops in this country.

In March, for the first time on record, there were no new cases of diphtheria reported among prisoners of war, while the number of new cases of jaundice continued at the same relatively low level as prevailed in February. On the other hand, the current month's morbidity from malaria (representing almost entirely cases presumably acquired outside of the United States) represented a rise for the third consecutive month to a rate of 81 per thousand, the highest thus far recorded. Morbidity from malaria was at about the same rate for Italian prisoners as for Germans. Morbidity from diarrhea and dysentery rose slightly but nonetheless remained relatively low, at a rate of about 7 per thousand. Two camps (Camp Davis N.C. and Huntsville, Texas) had sizeable outbreaks of bacterial food poisoning; this cause accounted in March for admissions at the rate of about 15 per thousand for all camps combined. Only small numbers of cases were reported for the other causes of admission considered in the following pages.

SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 31 MARCH 1944

PRISONERS OF WAR (CONT'D)

The camps reporting the highest morbidity from disease were Camp Davis, N. C. (G), Pine Grove Furnace, Pa. (G), Fort Jay, N.Y. (I) and Camp Pickett Va. (G), all of which had rates of more than 2000 per thousand. High morbidity at these camps was due respectively to bacterial food poisoning at Camp Davis, colds and influenza at Pine Grove Furnace, and malaria at Camp Pickett. Certain camps continued to have high admission rates for injury; namely, Clinton Miss. (G) and Camp Gruber, Ala. (G) both of which had rates of more than 300 per thousand in January, February, and March. In addition high rates of admission from injury were reported by the following camps, Camp Davis, N.C. (G), Camp Shelby, Miss. (G),

Sidnaw, Mich. (G), and Fort Lewis, Wash. (G) all of which had rates of over 400 per thousand in March.

The numbers of prisoners of war remaining under treatment in hospitals at prisoners of war camps as of 31 March 1944 and the corresponding rates per thousand strength are shown below. The numbers of prisoner patients at the end of the current month were almost exactly the same as at the end of February, although there were somewhat more Germans and correspondingly fewer Italians. In addition to the prisoners of war remaining under treatment in hospitals in the prisoner of war camps as shown below, there were 665 remaining under treatment in other hospitals; of these 601 were in General Hospitals.

| | Number Remaining | Prisoner Patients Remaining per 1000 Strength |
|----------|---------------------|---|
| German | 2555 | 20 |
| Italian | 736 | 15 |
| Japanese | 2 | 11 |
| Total | 3293 | 18 |
